iFIDS

Powerful Media Library

Media Library houses all uploaded media, PowerPoint, videos, PDF, Flash content, as well as all media generated from available templates. It's templated UI is easy to modify

Dynamic Content

iFIDS enables airports to customise predefined graphical layouts using background images, video, logos, banner drop downs or graphical elements.

Customisable Dashboard

The dashboard is fully customisable and contains all the documentation and quick access to all the work modules needed, favourite content and unpublished playlists.

Language Management

Content can be created in multiple languages and the preferred language content displayed based on the location of the customer facing iFIDS screen.

What we do

iFIDS (Intelligent Flight Information Display System) is a mature "full web" signage solution, deployed in the cloud or installable on site it provides dynamic flight and passenger information combined with customisable information feeds of your choosing. iFIDS enables you to streamline the process of combining traditional FIDS with a broad range of digital media assets which could include onward travel information, news or weather updates, advertising and promotions or the ability to enhance your social media presence. iFIDS can also be pre-configured to provide emergency information such as directions to emergency exits.

In short

iFIDS centralises control and visibility of all FIDS and onsite passenger information services. Combining the FIDS under one central management solution alongside the airport's other messaging systems whether information, commercial or for safety purposes ensures your messages are presented in just the place you want them to be and where most of your passengers are already looking; at the iFIDS displays. Combined with the control to instantly update or change the displayed data you can ensure your passengers miss nothing.

Contact us to find out more about us and the full range of solutions and services we provide.
